

Clinic Appointment No-Show Dashboard

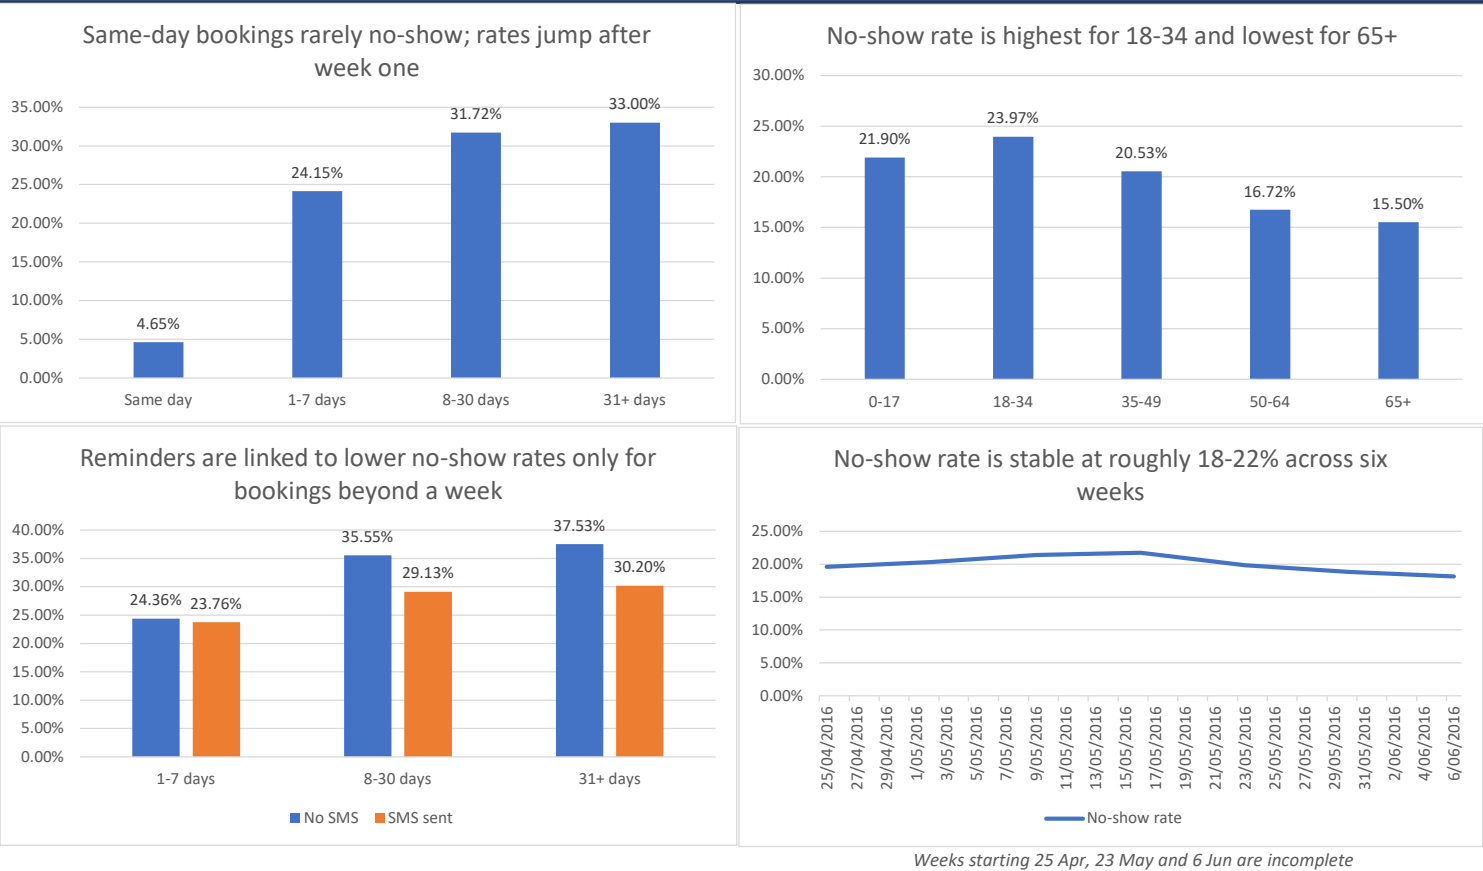

Public appointment dataset (source and checks on the Notes sheet). The target is an assumption.

Assumed target no-show rate 15%

Headline measures

Total Appointments	No-show rate	Average wait (days)
110,521	20.2%	10.2

No-show rate by factor

Key findings

- Wait time is the strongest factor: no-show rates rise from 4.7% for same-day bookings to 24.2% (1-7 days), 31.7% (8-30 days) and 33.0% (31+ days).
- Reminders are associated with lower no-show rates only for bookings beyond a week (about 6-7 points lower); within 1-7 days the difference is under 1 point.
- Age matters: no-show rates are highest for 18-34 (24.0%) and lowest for 65+ (15.5%), and wait time does not explain the gap.
- Weekday and week-to-week differences are small (19.4-21.2% by weekday, 18.1-21.7% by week).

Recommended actions

- Offer more early appointment slots, since same-day and first-week bookings are far more likely to be attended.
- Focus reminders and confirmation calls on bookings made more than a week ahead, especially for 18-34 year olds.
